

From using know-how to taking action. Autonomous agents that understand your business and execute tasks on your behalf

Launching in January 2026: a solution combining cotomi ACT - the world's first task-automation agent technology to surpass human task success rates - with software, consulting, and operation and maintenance services

Issues and background

Know-how and procedures for digital tasks, such as project schedule management, tend to accumulate with individuals and are often inadequately shared among the overall organization or insufficiently standardized. With conventional technologies, every time a screen layout changes, a redesign is required resulting in significant operational costs and burdens.

Flexible, high-performance agents automating a wide variety of tasks

Even unstructured tasks that require flexible decision-making depending on the situation that were difficult to address with RPA, can be carried out flexibly on your behalf with high-performance agents.

No training required! Know-how is automatically extracted from user behavior

Without the need for time-consuming training or manual creation, simply performing work as usual allows NEC cotomi Act to learn operational processes and know-how. This allows your organization to share mobilized know-how.

Enables safe and secure operation taking company rules and policy into consideration

By configuring and running the agents to take each individual company's governance and internal rules into consideration, it is possible to utilize autonomous agents safely and securely.
