| Final Action                                                                | No Operation                                            | emergency/action                   | 1 to 6, 8 to 14, 16 | The following parameter values can be specified:<br>1: No Operation<br>2: Stop Group<br>3: Stop cluster service<br>4: Stop cluster service and shutdown OS<br>5: Stop cluster service and reboot OS<br>6: Generate intentionally stop error<br>8: Sysrq Panic<br>9: Keepalive Reset<br>10: Keepalive Panic<br>11: BMC Reset<br>12: BMC Power Off<br>13: BMC Power Cycle<br>14: BMC NMI<br>16: Stop Resource |

[60] It does not apply to PPC64 and PPC64LE.

## 9.33 Performing encryption (clpencrypt command)

Encrypts a character string.

**Command line**

`clpencrypt password`

**Description**

Encrypts the values required for cluster configuration data (e.g., passwords).

**Parameter****`password`**

Specify a character string to be encrypted.

**Return value**

|              |         |
|--------------|---------|
| 0            | Success |
| Other than 0 | Failure |

**Example of Execution**

```
# clpencrypt password
```

**Display examples**

```
20220001111abaabdbb35c04
```

**Error Messages**

| Message            | Cause/Solution                                                                    |
|--------------------|-----------------------------------------------------------------------------------|
| Invalid parameter. | The parameter is invalid. Check if there is any error in its format or parameter. |

## 9.34 Adding a firewall rule (clpfwctrl command)

Adds or deletes a firewall rule on servers for EXPRESSCLUSTER.

### Command line

```
clpfwctrl --add [--zone=<ZONE>]  
clpfwctrl --remove  
clpfwctrl --help
```

### Description

---

**Note:** Before executing this command, enable the server firewall.

---

---

**Note:** This command adds a rule to or deletes it from a firewall zone on a single server, and therefore must be executed on every server for which you want the rule to be added or deleted.

---

---

**Note:** Execute this command immediately after installing EXPRESSCLUSTER and directly after applying configuration data.

---

---

**Note:** This command supports only environments where the firewall-cmd and firewall-offline-cmd commands can be used.

---

A rule can be added to a firewall zone for accessing port numbers for EXPRESSCLUSTER, and the added rule can be deleted from the zone.

For more information on port numbers to be specified with this command, and for that on protocols, see "Getting Started Guide" -> "Notes and Restrictions" -> "Before installing EXPRESSCLUSTER" -> "Communication port number".

Add a rule with the following name to a firewall zone. If the rule name is already used, first delete it, then add it again. Do not change the rule name.

- Rule name
  - clusterpro

### Option

**--add** [--zone=<ZONE>]  
Adds a firewall rule, to a zone (if specified). If no zone is specified, the rule is added to the default zone.

**--remove**  
Deletes the added firewall rule.

**--help**  
Displays the usage.

**Return value**

|              |         |
|--------------|---------|
| 0            | Success |
| Other than 0 | Failure |

**Notes**

Execute this command as root.

This command does not add an outbound firewall rule. Adding it requires a separate procedure.

Once a JVM monitor resource is registered, this command always allows the port number for managing the resource.

Executing this command discards the firewall configuration that is temporarily set on the memory.

**Example of Execution**

Adding a rule to the default zone:

```
# clpfwctrl.sh --add  
Command succeeded.
```

**Example of Execution**

Adding a rule to the home zone:

```
# clpfwctrl.sh --add --zone=home  
Command succeeded.
```

**Example of Execution**

Deleting the added rule:

```
# clpfwctrl.sh --remove  
Command succeeded.
```

**Error Messages**

| Message                                                                                                     | Cause/Solution                                                          |

## **TROUBLESHOOTING**

This chapter provides instructions for troubleshooting problems with EXPRESSCLUSTER.

This chapter covers:

- 10.1. *Troubleshooting*
- 10.2. *Troubleshooting problems with VERITAS volume manager*
- 10.3. *To confirm the progress of the fsck / xfs\_repair command*

## 10.1 Troubleshooting

The following provides instructions for troubleshooting problems you experience in operating the EXPRESSCLUSTER system.

### 10.1.1 When the EXPRESSCLUSTER system does not start or end

A cluster system starts working by restarting servers after installing EXPRESSCLUSTER. If your cluster system does not behave properly, check the following:

1. Registration of cluster configuration data

The cluster configuration data should be registered with all servers (which will form a cluster system) when you cluster them. If the cluster configuration data does not exist in the following path, the data may not be registered yet. Check it is registered.

```
/opt/nec/clusterpro/etc/clp.conf
```

If the cluster configuration data does not exist in the above path, see "Creating the Cluster Configuration Data" in the "Installation and Configuration Guide" for registering the data.

2. Server names and IP addresses in the cluster configuration data

Check the server names and IP addresses are valid.

```
(# hostname,# ifconfig....)
```

3. License registration

The license may not be registered yet. Run the following command on all servers in the cluster to confirm the license is registered:

```
# clplcnscl -l -a
```

See "*Managing licenses (clplcnscl command)*" in "9.2. EXPRESSCLUSTER commands" in this guide for more information on the above command.

If you are using the trial version license or fixed term license, confirm if it is not expired yet.

4. EXPRESSCLUSTER service start status

Run the following command to check the settings for starting service of EXPRESSCLUSTER:

**For init.d environment:**

```
# chkconfig --list clusterpro
clusterpro 0:off 1:off 2:off 3:on 4:off 5:on 6:off
```

**For systemd environment:**

```
# systemctl is-enabled clusterpro
```

5. Cluster process status

Run the following command to check if EXPRESSCLUSTER is working properly:

```
# ps -ef | grep clp
```

```
root 1669      1 0 00:00 ? 00:00:00 clpmonp -event -a 2 -r 0 -w 0
root 1670 1669 0 00:00 ? 00:00:00 clpevent
```

```
root 1684      1 0 00:00 ? 00:00:00 clpmonp -trnsv -a 2 -r 0 -w 0
root 1685 1684 0 00:00 ? 00:00:00 clptrnsv
root 1784      1 0 00:00 ? 00:00:00 /opt/nec/clusterpro/bin/clppm
root 1796 1795 0 00:00 ? 00:00:00 clprc
root 1809 1808 0 00:00 ? 00:00:00 clprm
root 1813 1812 0 00:00 ? 00:00:00 clpnm
root 1818 1813 0 00:00 ? 00:00:00 clplanhb
root 1820 1813 0 00:00 ? 00:00:00 clpdiskhb
root 1823 1813 0 00:00 ? 00:00:00 clplankhb
root 1935      1 0 00:00 ? 00:00:00 clpmonp -webmgr -a 2 -o -start -r 0 -w 0
root 1936 1935 0 00:00 ? 00:00:00 clpwebmc -start
root 1947      1 0 00:00 ? 00:00:00 clpmonp -webalert -a 2 -r 0 -w 0
root 1948 1947 0 00:00 ? 00:00:00 clpaltid
```

If you can check the run statuses of the following processes by executing the ps command, EXPRESSCLUSTER is working properly.

- Event process and data transfer process

```
root 1685 1684 0 00:00 ? 00:00:00 clptrnsv
root 1669      1 0 00:00 ? 00:00:00 clpmonp -event
root 1670 1669 0 00:00 ? 00:00:00 clpevent
root 1684      1 0 00:00 ? 00:00:00 clpmonp -trnsv
```

If the event process is not started yet, the process manager described in the following section will not start.

- Process manager

```
root 1784 1 0 00:00 ? 00:00:00 /opt/nec/clusterpro/bin/clppm
```

By starting up this process, the following processes are generated. Therefore, if any error such as error in cluster configuration data file is detected, EXPRESSCLUSTER will not start.

```
clprc
clprm
```

- Resource control process:

```
root 1796 1795 0 00:00 ? 00:00:00 clprc
```

\* This process can start up even if no group resources are registered yet.

- Resource monitor process:

```
root 1809 1808 0 00:00 ? 00:00:00 clprm
```

\* This process can start up even if no monitor resources are registered yet.

- Server management process:

```
root 1813 1812 0 00:00 ? 00:00:00 clpnm
```

- Heartbeat process:

```
root 1813 1817 0 00:00 ? 00:00:00 clplanhb
root 1813 1819 0 00:00 ? 00:00:00 clpdiskhb
root 1823 1813 0 00:00 ? 00:00:00 clplankhb
```

If a disk heartbeat resource has been added to the heartbeat resources in the cluster configuration data, clpdiskhb is started. If a kernel mode LAN heartbeat resource has been added, clplankhb is started.

- WebManager process:

```
root 1936 1935 0 00:00 ? 00:00:00 clpwebmc -start
```

- Alert process:

```
root 1948 1947 0 00:00 ? 00:00:00 clpaltd
```

The display style of the ps command may look different from the above depending on the distribution.

## 6. Cluster process status ~ For Replicator~

Run the following commands to check if EXPRESSCLUSTER is working properly:

```
# ps -ef | grep clp
```

```
root 1669      1 0 00:00 ? 00:00:00 clpmonp -event -a 2 -r 0 -w 0
root 1670 1669 0 00:00 ? 00:00:00 clpevent
root 1684      1 0 00:00 ? 00:00:00 clpmonp -trnsv -a 2 -r 0 -w 0
root 1685 1684 0 00:00 ? 00:00:00 clptrnsv
root 1696      1 0 00:00 ? 00:00:00 clpmonp -mdagent -a 5 -r 0 -w 30
root 1697 1696 0 00:00 ? 00:00:00 clpmdagent
root 1784      1 0 00:00 ? 00:00:00 /opt/nec/clusterpro/bin/clppm
root 1796 1795 0 00:00 ? 00:00:00 clprc
root 1809 1808 0 00:00 ? 00:00:00 clprm
root 1813 1812 0 00:00 ? 00:00:00 clpnm
root 1818 1813 0 00:00 ? 00:00:00 clplanhb
root 1823 1813 0 00:00 ? 00:00:00 clplankhb
root 1935      1 0 00:00 ? 00:00:00 clpmonp -webmgr -a 2 -o -start -r 0 -w 0
root 1936 1935 0 00:00 ? 00:00:00 clpwebmc -start
root 1947      1 0 00:00 ? 00:00:00 clpmonp -webalert -a 2 -r 0 -w 0
root 1948 1947 0 00:00 ? 00:00:00 clpaltd
```

If you can check the run statuses of the following processes by executing the ps command, EXPRESSCLUSTER is working properly.

- Event process, data transfer process, and mirror agent

```
root 1696      1 0 00:00 ? 00:00:00 clpmonp --mdagent -a 5 -r 0 -w 30
root 1697 1696 0 00:00 ? 00:00:00 clpmdagent
```

If the event process is not started yet, the process manager in the following section will not start.

- Process manager

```
root 1784 1 0 00:00 ? 00:00:00 /opt/nec/clusterpro/bin/clppm
```

By starting up this process, the following processes are generated. Therefore, if any error such as error in cluster configuration data file is detected, EXPRESSCLUSTER will not start.

```
clprc
clprm
```

- Resources control process:

```
root 1796 1795 0 00:00 ? 00:00:00 clprc
```

\* This process can start up even if no group resources are registered yet.

- Resource monitor process:

```
root 1809 1808 0 00:00 ? 00:00:00 clprm
```

\* This process can start up even if no monitor resources are registered yet.

- Server management process:

```
root 1813 1812 0 00:00 ? 00:00:00 clpnm
```

- Heartbeat process:

```
root 1818 1813 0 00:00 ? 00:00:00 clplanhb
root 1823 1813 0 00:00 ? 00:00:00 clplankhb
```

If a kernel mode LAN heartbeat resource has been added, clplankhb is started.

- WebManager process:

```
root 1936 1935 0 00:00 ? 00:00:00 clpwebmc - start
```

- Alert process:

```
root 1948 1947 0 00:00 ? 00:00:00 clpalttd
```

The display style of the ps command may look different from the above depending on the distribution.

#### 7. Loading of the mirror driver ~For Replicator~

Run the lsmod command. Check that the run result of lsmod contains the following loadable module.

```
Liscal
```

#### 8. Loading of the kernel mode LAN heartbeat driver ~For kernel mode LAN heartbeat resource~

Run the lsmod command. Check that the run result of lsmod contains the following loadable module.

```
clpkhb
```

#### 9. Loading of the keepalive driver ~For userw User mode monitor resource (keepalive)~

Run the lsmod command. Check that the run result of lsmod contains the following loadable module.

```
clpka
```

#### 10. Normal startup of the cluster from syslog

To see EXPRESSCLUSTER processes are working properly by looking into syslog, find the following messages.

- To check the process manager's startup:

```
<type: pm><event: 1> Starting the cluster daemon...
```

- To check heartbeat resources' activation:

```
<type: nm><event: 3> Resource lanhb1 of server server1 has started.
<type: nm><event: 3> Resource diskhb1 of server server1 has started.
<type: nm><event: 1> Server server1 has started.
<type: nm><event: 3> Resource diskhb1 of server server2 has started.
<type: nm><event: 1> Server server2 has started.
<type: nm><event: 3> Resource lanhb1 of server server2 has started.
```

You will see the above messages when the followings are specified for heartbeat resources in a 2-node configuration.

lanhb1 LAN heartbeat resources  
diskhb1 Disk heartbeat resources

- To check group resources' activation:

```
<type: rc><event: 10> Activating group grp1 has started.  
<type: rc><event: 30> Activating fip1 resource has started.  
<type: rc><event: 31> Activating fip1 resource has completed.  
<type: rc><event: 30> Activating disk1 resource has started.  
<type: rc><event: 31> Activating disk1 resource has completed.  
<type: rc><event: 11> Activating group grp1 has completed.
```

You will see the above messages when the group resource, grp1, is activated on server1. The group resources' configuration data is as follows:

fip1 Floating IP addresses resources  
disk1 Shared disk resources

- To check monitor resources' startup:

```
<type: rm><event: 1> Monitoring userw has started.  
<type: rm><event: 1> Monitoring ipw1 has started.
```

You will see the above messages when the monitor resources are specified as follows:

userw User mode monitor resources  
ipw1 IP monitor resources

- To check license consistency:

Product version

```
<type: lcns><event: 1> The number of licenses is 2. (Product_  
↪name:EXPRESSCLUSTER X)
```

You will see the above message when 2-CPU license is registered.

Trial version

```
<type: lcns><event: 2> The trial license is valid until yyyy/mm/dd. (Product_  
↪name: EXPRESSCLUSTER X)
```

## 11. Successful startup of the cluster ~For Replicator~

To see EXPRESSCLUSTER processes are working properly by looking into syslog, find the following messages.

- To check the mirror agent's startup:

```
<type: mdagent><event: 1> Agent has started successfully.
```

- To check the mirror driver's startup:

```
<type: liscsl><event: 101> Registered blkdev with major=218.
```

- To check the process manager's startup:

```
<type: pm><event: 1> Starting the cluster daemon...
```

- To check heartbeat resources' activation:

```
<type: nm><event: 3> Resource lanhb1 of server server1 has started.
<type: nm><event: 1> Server server1 has started.
<type: nm><event: 3> Resource lanhb1 of server server2 has started.
<type: nm><event: 1> Server server2 has started.
```

You will see the above messages when the following is specified for heartbeat resources in a 2-node configuration.

lanhb1 LAN heartbeat resources

- To check group resources' activation:

```
<type: rc><event: 10> Activating group grp1 has started.
<type: rc><event: 30> Activating fip1 resource has started.
<type: rc><event: 31> Activating fip1 resource has completed.
<type: rc><event: 30> Activating md1 resource has started.
<type: rc><event: 31> Activating md1 resource has completed.
<type: rc><event: 11> Activating group grp1 has completed.
```

You will see the above messages when the group resource, grp1, is activated on server1. The group resources' configuration data is as follows;

fip1 Floating IP addresses resources

md1 Mirror disk resources

- To check start of monitoring by monitoring resources:

```
<type: rm><event: 1> Monitoring userw has started.
<type: rm><event: 1> Monitoring ipw1 has started.
<type: rm><event: 1> Monitoring mdw1 has started.
<type: rm><event: 1> Monitoring mdnw1 has started.
```

You will see the above messages when the monitor resources are specified as follows;

userw User mode monitor resources

ipw1 IP monitor resources

mdw1 Mirror disk monitor resources

mdnw1 Mirror disks connect monitor resources

- To check license consistency:

Product version

```
<type: lcns><event: 1> The number of licenses is 2. (Product name:
↳EXPRESSCLUSTER X)
```

You will see the above message when a 2-CPU license is registered.

Trial version

```
<type: lcns><event: 2> The trial license is valid until yyyy/mm/dd. (Product
↳name:EXPRESSCLUSTER X)
```

## 12. Free disk space

Run the df command to check the size of the free disk space in the file system that contains /opt/nec/clusterpro. For details on the disk space to be used by the EXPRESSCLUSTER Server, see "Installation requirements for EXPRESSCLUSTER" in "Getting Started with Guide".

13. Usage of memory or OS resource

Run the top or free command to check the OS memory usage and CPU utilization.

### 10.1.2 When activating or deactivating group resources fails

If any error is detected in activation of a group resource, detailed error information is logged in the alert and syslog. Examine the logs to find the cause of the error and take appropriate action for it.

1. Floating IP resource

Check that the specified IP address is not already used on the network or you have not specified an IP address of a wrong network segment.

For more information on errors, see "*Floating IP resources*".

2. Disk resources

Check that the device and mount point exist, and the file system is configured.

For more information on errors, see "*Disk resources*".

3. EXEC resources

Check that the script path is correct and what is scripted is appropriate.

For more information on errors, see "*EXEC resources*".

4. Mirror disk resources ~For Replicator~

Check that the devices and mount points exist, and the cluster partitions and data partitions are allocated.

Check the file system specified for mirror disk resources is available as well.

For more information on errors, see "*Mirror disk resources*".

5. Hybrid disk resources ~For Replicator DR~

Check that the devices and mount points exist, and the cluster partitions and data partitions are allocated.

Check the file system specified for mirror disk resources is available as well.

For more information on errors, see "*Hybrid disk resources*".

### 10.1.3 When a monitor resource error occurs

If a monitor resource detects any error, detailed information on error is logged in the alert and syslog. Examine the logs to find the cause of the error and take appropriate action for it.

1. Error detected by the IP monitor resource

Check that you can send packets with the ping command, and other network segments are routed if any.

For more information on errors, see "*IP monitor resources*".

2. Error detected by the disk monitor resource

Check that a disk device exists. If you are using a shared disk, check SCSI or fibre cables are securely connected to the shared disk.

For more information on errors, see "*Disk monitor resources*".

3. Error detected by the PID monitor resource

Check that the process to be monitored exists by using a command, such as ps command.

For more information on errors, see "*PID monitor resources*".

4. Error detected by the User mode monitor resource (monitor method: softdog)

When "initialization failure" is detected, confirm that the softdog driver can be loaded by using the insmod command of OS.

Furthermore, when "server reset" occurs, check the load status of the user space.

For more information on errors, see "*User mode monitor resources*".

5. Error detected by the mirror disk monitor resource ~For Replicator~  
Check that the disk devices exist, and the cluster partitions and data partitions are allocated. Confirm that the Mirror Agent is active.  
For more information on errors, see "*Mirror disk monitor resources*".
6. Error detected by the mirror disks connect monitor resource ~For Replicator~  
Check that the mirror disk is connected and the Mirror Agent is active.  
For more information on errors, see "*Mirror disk connect monitor resources*".
7. Error detected by the hybrid disk monitor resource ~For Replicator DR~  
Check that the mirror disk is connected and the Mirror Agent is active.  
For more information on errors, see "*Hybrid disk monitor resources*".
8. Error detected by the hybrid disk connect monitor resource ~For Replicator DR~  
Check that the mirror disk is connected and the Mirror Agent is active.  
For more information on errors, see "*Hybrid disk connect monitor resources*".
9. Error detected by the NIC Link Up/Down monitor resource  
Check how the NIC of the server is connected to the network device.  
For more information on errors, see "*NIC link up/down monitor resources*".

#### 10.1.4 When a heartbeat time-out occurs

Possible causes of heartbeat time-out between servers are listed below:

| Cause                                                                      | Solution                                                                                                                                                                                                                                                                         |
|----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Disconnection of LAN/disk cables                                           | <p>For disk cables, check if the cables are connected securely.</p> <p>For LAN cables, check that you can send packets with the ping command.</p>                                                                                                                                |
| Heavily loaded user space (resulting in misinterpreted heartbeat time-out) | <p>Run the following command in advance to extend the heartbeat time-out when running an application that can make the OS heavily loaded for a long time.</p> <pre># clptoratio -r 3 -t 1d</pre> <p>The above mentioned command triples the heartbeat time-out for 24 hours.</p> |

### 10.1.5 When network partitioning occurs

Network partitioning indicates that all communication routes are blocked between servers. This section describes how you can check whether or not the network is partitioned and what you should do about it. The following examples assume that you have registered LAN kernel mode LAN, disk for heartbeat resources in a 2-node cluster configuration.

When all heartbeat resources are normal (the network is not partitioned), the result of executing the `clpstat` command is:

**When you run the command on server1**

**# clpstat -n**

```
===== HEARTBEAT RESOURCE STATUS =====
Cluster : cluster
*server0 : server1
  server1 : server2

HB0 : lanhb1
HB1 : lanhb2
HB2 : lankhb1
HB3 : lankhb2
HB4 : diskhb1

[on server0 : Online]
  HB   0   1   2   3   4
-----
server0 : o   o   o   o   o
server1 : o   o   o   o   o

[on server1 : Online]
  HB   0   1   2   3   4
-----
server0 : o   o   o   o   o
server1 : o   o   o   o   o
```

**When you run the command on server2**

**# clpstat -n**

```
===== HEARTBEAT RESOURCE STATUS =====
Cluster : cluster
  server0 : server1
*server1 : server2

HB0 : lanhb1
HB1 : lanhb2
HB2 : lankhb1
HB3 : lankhb2
HB4 : diskhb1

[on server0 : Online]
  HB   0   1   2   3   4
-----
server0 : o   o   o   o   o
server1 : o   o   o   o   o
```

(continues on next page)

(continued from previous page)

```
[on server1 : Online]
  HB  0  1  2  3  4
```

```
-----
server0 : o  o  o  o  o
server1 : o  o  o  o  o
=====
```

When the network is partitioned, the result of executing the clpstat command is what is described below. Both servers recognize each other that the counterpart is down.

#### When you run the command on server1

# clpstat -n

```
===== HEARTBEAT RESOURCE STATUS =====
Cluster : cluster
*server0 : server1
  server1 : server2

HB0 : lanhb1
HB1 : lanhb2
HB2 : lankhb1
HB3 : lankhb2
HB4 : diskhb1

[on server0 : Caution]
  HB  0  1  2  3  4

-----

server0 : o  o  o  o  o
server1 : x  x  x  x  x

[on server1 : Offline]
  HB  0  1  2  3  4

-----

server0 : -  -  -  -  -
server1 : -  -  -  -  -
=====
```

#### When you run the command on server2

# clpstat -n

```
===== HEARTBEAT RESOURCE STATUS =====
Cluster : cluster
  server0 : server1
*server1 : server2

HB0 : lanhb1
HB1 : lanhb2
HB2 : lankhb1
HB3 : lankhb2
HB4 : diskhb1
```

(continues on next page)

(continued from previous page)

```
[on server0 : Offline]
  HB    0    1    2    3    4
-----
server0 : -    -    -    -    -
server1 : -    -    -    -    -

[on server1 : Caution]
  HB    0    1    2    3    4
-----
server0 : x    x    x    x    x
server1 : o    o    o    o    o
=====
```

Shut down both servers immediately if the network is partitioned. Check the following for heartbeat resources.

1. LAN heartbeat resource
  - LAN cable status
  - Network interface status
2. Kernel mode LAN heartbeat resource
  - LAN cable status
  - Network interface status
3. Disk heartbeat resource
  - Disk cable status
  - Disk device status

If interconnection LAN is recovered from the network partitioning, EXPRESSCLUSTER causes the servers to shut down.

If EXPRESSCLUSTER detects that the same group is active on multiple servers, it causes the servers to shut down.

For the replicator, depending on the server shutdown timing, the statuses of mirror disk resources may not be the same after rebooting the server.

Depending on the timing of server shutdown, the status of mirror disk resources may be the one requiring forced mirror recovery, mirror recovery, or normal.

### 10.1.6 When all interconnection LANs are disconnected

This section describes how to check the status when all interconnections (LAN heartbeat resources, kernel mode LAN heartbeat resources) between the servers are disconnected. The following examples assume that you have registered LAN, disk for heartbeat resources in a 2-node cluster configuration. (You cannot register disks for the replicator.)

The following shows that the results of executing the clpstat command when all interconnections are disconnected and the disk is normal. Both servers recognize that the other server is running.

**When you run the command on server1**

```
# clpstat -n
```

```

===== HEARTBEAT RESOURCE STATUS =====
Cluster : cluster
*server0 : server1
  server1 : server2

HB0 : lanhb1
HB1 : lanhb2

server0 : x  x  x  x  o
server1 : o  o  o  o  o
=====

```

A failover does not occur when all interconnections are disconnected like the example above because communication can be achieved by disk heartbeats.

However, interconnections must be recovered as soon as possible because commands communicated by interconnections become unavailable.

Check the following for heartbeat resources:

1. LAN heartbeat resources
  - LAN cable status
  - Network interface status
2. Kernel mode LAN heartbeat resources
  - LAN cable status
  - Network interface status

When interconnects are also used as mirror disk connect in the replicator, a mirror break occurs if the interconnections (mirror disconnects) are disconnected. Run mirror recovery after restoring the interconnections.

### 10.1.7 Unavailable commands when interconnections are disconnected

#### Commands for cluster construction

| Command   | Description                                                                                                                                                                                                           | Remarks                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| clpcfctrl | Distributes the configuration information created by the Cluster WebUI to the servers registered in the configuration information.<br>Backs up the cluster configuration information to be used by the Cluster WebUI. | The configuration information cannot be distributed to other servers. |
| clplnsc   | Registers and displays the licenses of the product and trial versions of this product.                                                                                                                                | The license cannot be distributed to other servers.                   |

#### Commands for showing status

| Command | Description                                           | Remarks                                        |
|---------|-------------------------------------------------------|------------------------------------------------|
| clpstat | Displays the cluster status and settings information. | Statuses of other servers cannot be retrieved. |

#### Commands for cluster operation

| Command | Description                                                                                          | Remarks                                                 |
|---------|------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| clpcl   | Starts, stops, suspends and resumes the EXPRESSCLUSTER daemon.                                       | Other servers cannot be operated, suspended or resumed. |
| clpdown | Stops the EXPRESSCLUSTER daemon and shuts down a server registered in the configuration information. | Other servers cannot be operated.                       |

Continued on next page

Table 10.4 – continued from previous page

| Command    | Description                                                                        | Remarks                                                               |
|------------|------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| clpstdn    | Stops the EXPRESSCLUSTER daemon in the entire cluster, and shuts down all servers. | Other servers cannot be operated.                                     |
| clpgrp     | Starts, stops, and moves groups.                                                   | Only groups on the local server can be stopped.                       |
| clprsc     | Starts, stops and moves resources.                                                 | Resources of other servers cannot be operated.                        |
| clptoratio | Extends and displays time-out values of all servers in the cluster.                | Time-out ratios of other servers cannot be set.                       |
| clprexec   | Issues a request to execute the error correction action from the external monitor. | Some error correction actions cannot be executed on the local server. |

#### Commands for logs

| Command  | Description                       | Remarks                                    |
|----------|-----------------------------------|--------------------------------------------|
| clplogcc | Collects logs and OS information. | Logs of other servers cannot be collected. |

#### Commands for mirror (only for the Replicator)

| Command   | Description                                                                                                                                   | Remarks                                                                                  |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| clpmdstat | Displays the status and settings in information of mirroring                                                                                  | The mirror status of the remote server cannot be retrieved.                              |
| clpmdctrl | Activates/inactivates mirror disk resources and recovers mirroring.<br>Displays/changes the settings of the maximum number of request queues. | Do not use this command. because mirror disk resources of both servers may be activated. |

#### Commands for hybrid disk (only for the Replicator DR)

| Command   | Description                                                                                                                                   | Remarks                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| clphdstat | Displays the status and settings in information of hybrid disk resource.                                                                      | The status of the remote server cannot be retrieved.                                    |
| clphdctrl | Activates/inactivates mirror disk resources and recovers mirroring.<br>Displays/changes the settings of the maximum number of request queues. | Do not use this command because hybrid disk resources of both servers may be activated. |

### 10.1.8 Mounting mirror disks manually

This section describes how to manually mount mirror disks when you cannot start EXPRESSCLUSTER due to some sort of failure.

### 10.1.9 Normally mounting mirror disk when mirroring is available

Follow the steps below when the mirror agent (EXPRESSCLUSTER data mirror daemon) can be started while the EXPRESSCLUSTER daemon cannot.

1. Run the following command on the server where you want to mount disks.

```
clpmdctrl --active <mirror_disk_resource_name (Example: md1)>
```

2. The mount point of mirror disk resources becomes accessible. Written data is mirrored to the other server.

### 10.1.10 Forcibly mounting mirror disk when mirroring is not available

Follow the steps below to save data to mirror disks when neither the EXPRESSCLUSTER daemon nor the mirror agent (EXPRESSCLUSTER data mirror daemon) can be started.

However, the mirroring status up to the moment just before both the EXPRESSCLUSTER daemon and EXPRESSCLUSTER data mirror daemon became unable to be started must be normal, or you must know which server has the latest data.

1. The EXPRESSCLUSTER daemon cannot be started on Server 1 or Server 2.

Server 1 has the latest data.

Execute the following command on each server to prevent the EXPRESSCLUSTER service from starting:

```
clpsvcctrl.sh --disable -a
```

Fig. 10.1: Saving the data on the mirror disk (1)

2. Run the reboot command to restart the server that has the latest data or that activated the mirror disk resources last time. Shut down the other server with the shutdown command.

Restart Server 1, which has the latest data, and shut down Server 2.

Fig. 10.2: Saving the data on the mirror disk (2)

3. Run the mount command to mount a data partition on a mirror disk in the read-only mode.

```
(Example) mount -r -t ext3 /dev/sdb5 /mnt
```

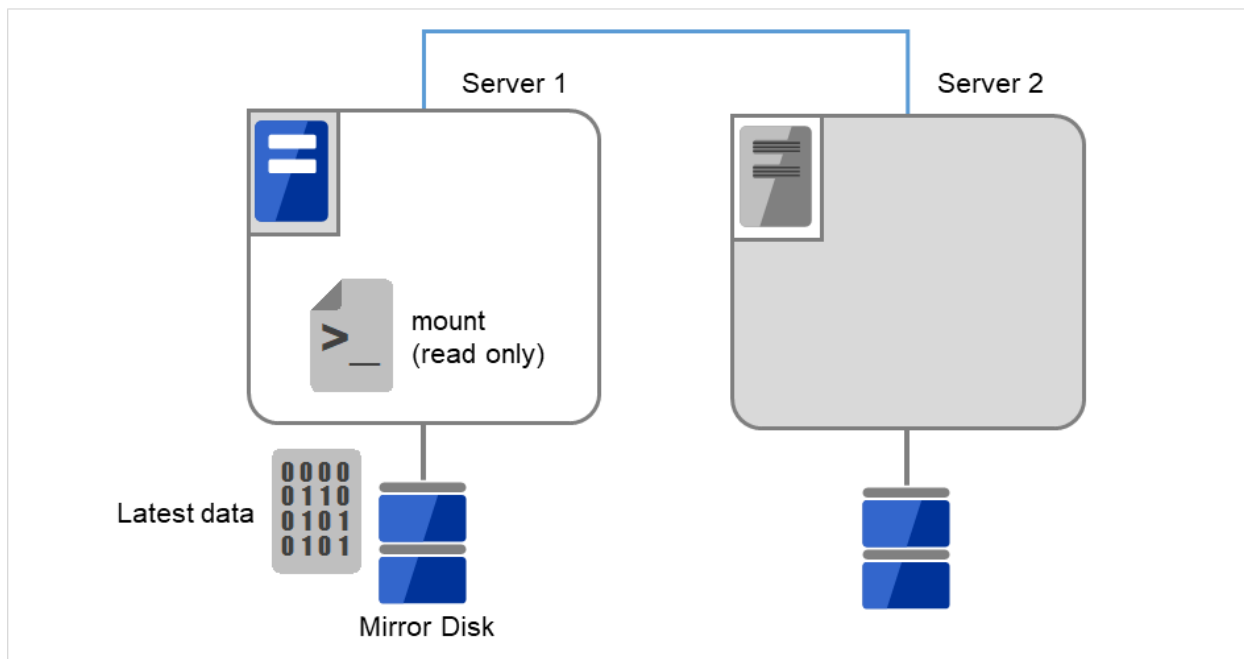

Fig. 10.3: Saving the data on the mirror disk (3)

4. Back up the data in the data partition on a DAT tape or other media.

Connect the backup device to Server 1, and back up the data in the data partition by using a command (e.g., tar, cpio).

Fig. 10.4: Saving the data on the mirror disk (4)

5. Unmount the mounted data partition.

Fig. 10.5: Saving the data on the mirror disk (5)

### 10.1.11 Mounting hybrid disks manually

This section describes how to manually mount hybrid disks when you cannot start EXPRESSCLUSTER due to a failure or any other reasons.

### 10.1.12 Normally mounting mirror disk when mirroring is available

Follow the steps below when the mirror agent (EXPRESSCLUSTER data mirror daemon) can be started while the EXPRESSCLUSTER daemon cannot.

1. Run the following command on the server where you want to mount disk.

```
clphdctrl --active <hybrid_disk_resource_name (Example: hd1)>
```

2. The mount point of hybrid disk resource becomes accessible. Written data is mirrored to the other server group.

### 10.1.13 Forcibly mounting mirror disk when mirroring is not available

Follow the steps below to save data to hybrid disks when neither the EXPRESSCLUSTER daemon nor the mirror agent (EXPRESSCLUSTER data mirror daemon) can be started.

This can be performed provided the mirroring status up to the moment just before both the EXPRESSCLUSTER daemon and EXPRESSCLUSTER data mirror daemon became unable to be started was normal, or you know which server has the latest data.

1. The EXPRESSCLUSTER daemon cannot be started on any servers.

Server 1 has the latest data.

Execute the following command on each server to prevent the EXPRESSCLUSTER service from starting:

```
clpsvcctrl.sh --disable -a
```

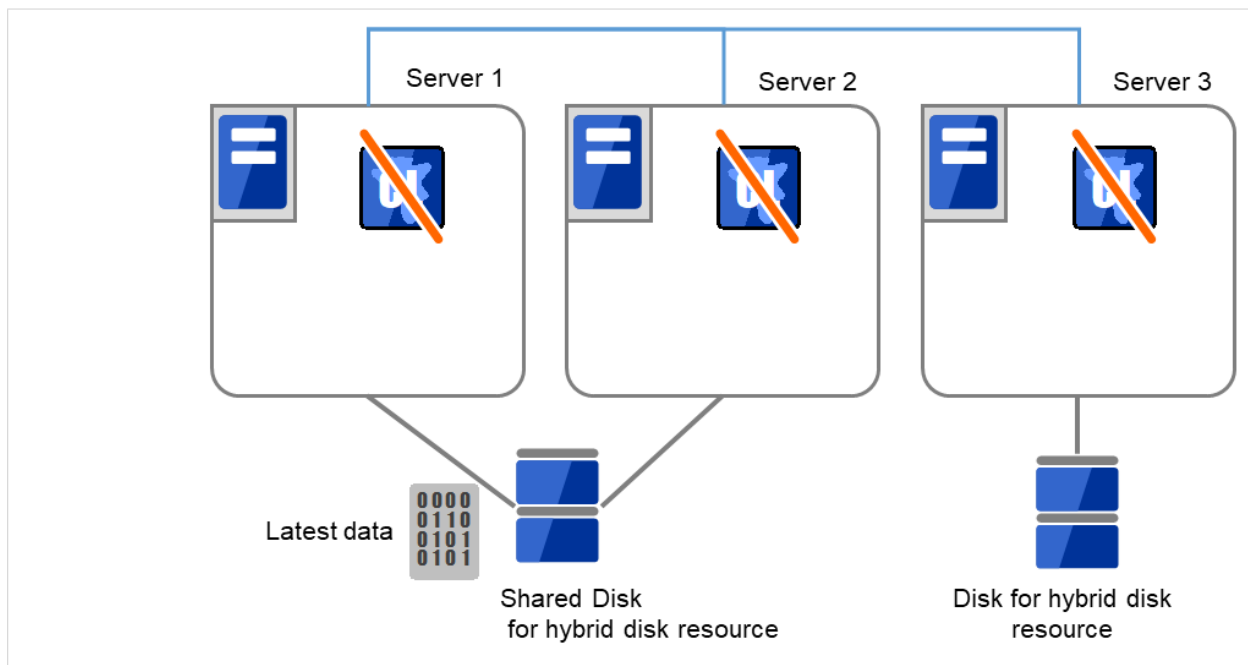

Fig. 10.6: Saving the data on the hybrid disk (1)

2. Run the reboot command to restart the server that has the latest data or that activated the hybrid disk resources last time. Shut down other servers with the shutdown command.

Restart Server 1, which has the latest data, and shut down both Server 2 and Server 3.

Fig. 10.7: Saving the data on the hybrid disk (2)

3. Run the mount command to mount the data partition on the hybrid disk in the read-only mode.

```
(Example) mount -r -t ext3 /dev/sdb5 /mnt
```

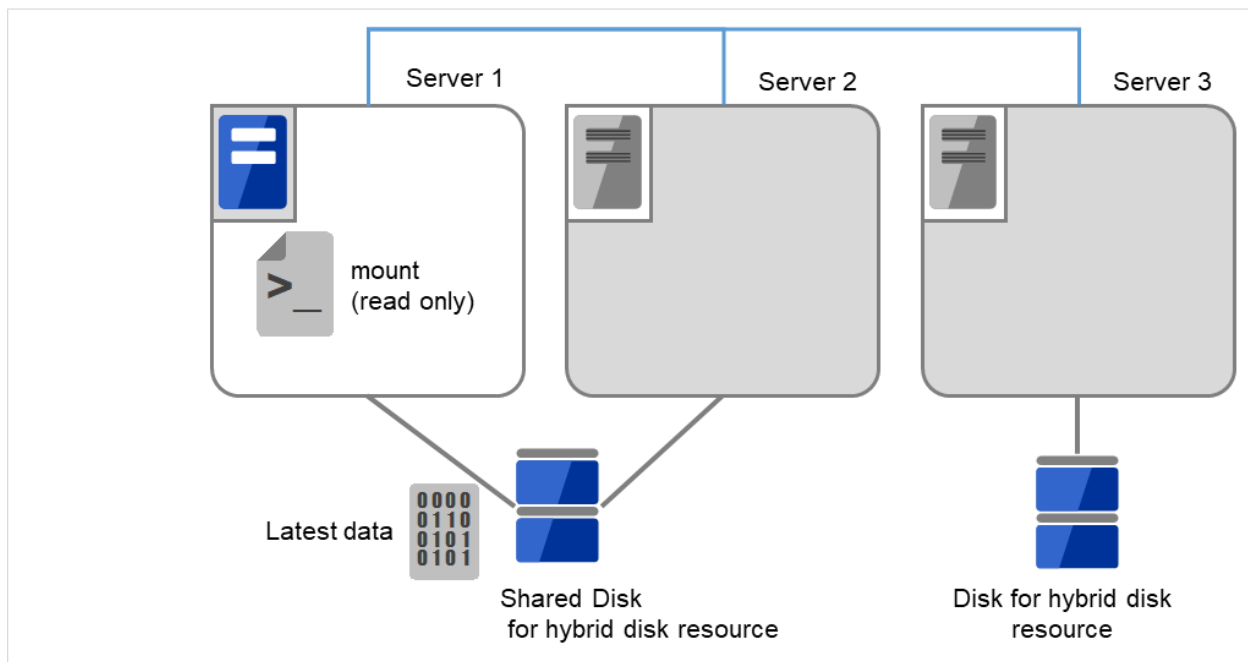

Fig. 10.8: Saving the data on the hybrid disk (3)

4. Back up the data in the data partition on a DAT tape or other medium.

Connect the backup device to Server 1, and back up the data in the data partition by using a command (e.g., tar, cpio).

Fig. 10.9: Saving the data on the hybrid disk (4)

5. Unmount the mounted data partition.

Fig. 10.10: Saving the data on the hybrid disk (5)

### 10.1.14 Manually running mkfs to mirror disk or hybrid disk

To recreate the file system of a mirror partition without changing the cluster or mirror configuration, follow the steps below:

1. Confirm that the cluster is in the normal status.
2. If you need to back up the data, see "Backup procedures" and "Restoration procedures" in "Verifying operation" in the "Installation and Configuration Guide" for the procedure.
3. Stop the group which has the mirror disk resources that you want to run the mkfs command.
4. Run the following command on the server where you will run mkfs.

For mirror disk:

```
clpmdctrl --active -nomount <mirror_disk_resource_name (Example: md1)>
```

For hybrid disk:

```
clphdctrl --active -nomount <hybrid_disk_resource_name (Example: hd1)>
```

5. Run the mkfs command to configure a file system.

Because disks are mirrored, the mkfs command is also run on the other server.

```
(Example) mkfs -t ext3 <mirror_partition_device_name (Example: /dev/NMP1)>
```

6. If you need to restore the backup data, see "Backup procedures" or "Restoration procedures" in "Verifying operation" in the "Installation and Configuration Guide" for the procedure.
7. After confirming the completion of the file system creation, run the following command:

For mirror disk:

```
clpmdctrl --deactive <mirror_disk_resource_name (Example: md1)>
```

For mirror disk:

```
clphdctrl --deactive <hybrid_disk_resource_name (Example: md1)>
```

### 10.1.15 Recovering from mirror breaks

When the auto-mirror recovery is enabled, no special operation is required. Mirroring is automatically recovered.

However, if mirroring needs to be recovered forcibly, execution of a command or operations for forcible mirror recovery using the Cluster WebUI are required.

The difference mirror recovery function is disabled in the forcible mirror recovery and the data is fully copied.

If the auto-mirror recovery is disabled, you have to recover mirroring by executing a command or using the Cluster WebUI.

### 10.1.16 Automatically recovering from mirroring

When the auto-mirror recovery is enabled, mirroring is recovered under the following conditions:

1. Mirror disk resources or hybrid disk resources are active.
2. The server where mirror disk resources or hybrid disk resources are active contains the latest data.
3. Servers in the cluster are in the normal status, and you can verify their mirroring statuses.
4. The data among the servers is not the same.

The auto-mirror recovery is not performed if any of the following applies.

1. One of the servers is not started.
2. You cannot confirm the mirroring status of the other server.  
(For example, communication is impossible or the cluster of the other server stops.)
3. There is no server whose mirror status is normal.
4. The mirror status is pending (hybrid disk resources only)
5. Mirror synchronization is stopped manually.  
(For example, synchronization is stopped by executing the `--break` option with the `clpmdctrl` or `clphdctrl` command, or the GREEN-GREEN status is changed to the GREEN-RED status by clicking the **Mirror break** icon on the **Mirror disks** tab of the Cluster WebUI. This excludes, however, the case in which the server is restarted after synchronization stops or in which synchronization is started manually.)
6. The mirror disk monitor resource and hybrid disk monitor resource stopped.  
(For example, the relevant monitor resource is temporarily stopped by the `clpmonctrl` command or Cluster WebUI.)

For information on how to verify the progress of recovering mirroring, see "[Checking the mirror recovery progress with a command](#)" and "[Checking the mirror recovery progress from the Cluster WebUI](#)".

### 10.1.17 Checking the mirror break status with a command

Run the following command to view the mirror break statuses.

For mirror disk:

```
clpmdstat --mirror <mirror_disk_resource_name (Example: md1)>
```

For hybrid disk:

```
clphdstat --mirror <hybrid_disk_resource_name (Example: hd1)>
```

You can view the statuses of mirror disk resource or hybrid disk resource by running the `clpmdstat` command or `clphdstat` command.

1. When normal:

|                       |         |         |
|-----------------------|---------|---------|
| Mirror Status: Normal |         |         |
| md1                   | server1 | server2 |
| -----                 |         |         |
| Mirror Color          | GREEN   | GREEN   |

2. When the mirror recovery is required:

```
Mirror Status: Abnormal
Total Difference: 1%
```

| md1                | server1             | server2 |
|--------------------|---------------------|---------|
| Mirror Color       | GREEN               | RED     |
| Lastupdate Time    | 2018/03/04 17:30:05 | --      |
| Break Time         | 2018/03/04 17:30:05 | --      |
| Disk Error         | OK                  | OK      |
| Difference Percent | 1%                  | --      |

### 3. When the forcible mirror recovery is required:

```
Mirror Status: Abnormal
Total Difference: 1%
```

| md1                | server1             | server2             |
|--------------------|---------------------|---------------------|
| Mirror Color       | RED                 | RED                 |
| Lastupdate Time    | 2018/03/09 14:07:10 | 2004/03/09 13:41:34 |
| Break Time         | 2018/03/09 14:06:21 | 2004/03/09 13:41:34 |
| Disk Error         | OK                  | OK                  |
| Difference Percent | 1%                  | 1%                  |

### 4. While the mirroring is being recovered:

See "*Checking the mirror recovery progress with a command*".

## 10.1.18 Checking the mirror recovery progress with a command

Run the following command to view the progress of recovering mirroring.

For mirror disk:

```
clpmdstat --mirror <mirror_disk_resource_name (Example: md1)>
```

For hybrid disk:

```
clphdstat --mirror <hybrid_disk_resource_name (Example: hd1)>
```

You will see the following data while mirroring is being recovered.

```
Mirror Status: Recovering
```

| md1             | server1            | server2 |
|-----------------|--------------------|---------|
| Mirror Color    | YELLOW             | YELLOW  |
| Recovery Status | Value              |         |
| Status:         | Recovering         |         |
| Direction:      | server1 -> server2 |         |
| Percent:        | 7%                 |         |
| Used Time:      | 00:00:09           |         |
| Remain Time:    | 00:01:59           |         |

You will see the following information when the mirror recovery is successfully completed.

```
Mirror Status: Normal
```

| mdl          | server1 | server2 |
|--------------|---------|---------|
| -----        |         |         |
| Mirror Color | GREEN   | GREEN   |

### 10.1.19 Recovering mirror with a command

Run the following command to start the mirror recovery.

For mirror disk:

```
clpmdctrl --recovery <mirror_disk_resource_name (Example: mdl)>
```

For hybrid disk:

```
clphdctrl --recovery <hybrid_disk_resource_name (Example: hd1)>
```

When FastSync Option is enabled, only the difference data is recovered. Therefore, the mirror recovery takes less time than when FastSync Option is disabled(FastSync technology).

This command immediately returns the control once the mirror recovery starts. For information on how to verify the mirror recovery progress, see "[Checking the mirror recovery progress with a command](#)" and "[Checking the mirror recovery progress with a command](#)".

### 10.1.20 Running the forcible mirror recovery with a command

If EXPRESSCLUSTER cannot determine which server contains the latest data, you have to run the forcible mirror recovery.

In this case, you have to manually identify the server that holds the latest data, and perform the forcible mirror recovery.

Identify the server that holds the latest data by any of the following means:

- Using the Cluster WebUI
  1. In the **Mirror disks** tab of Cluster WebUI, click the mirror disk resource to be checked.
  2. Click **Details** icon.
  3. See the last update time stamp (Last Data Updated Time) to identify the server which has the latest data. However, this Last Data Updated Time depends on the operating system's clock.
- Using the clpmdstat or clphdstat command

Confirmation method is the same as Cluster WebUI except that you use a command.

1. Run the following command.

For mirror disk:

```
clpmdstat --mirror <mirror_disk_resource_name (Example: mdl)>
```

For hybrid disk:

```
clphdstat --mirror <hybrid_disk_resource_name (Example: hd1)>
```

2. See the last update time stamp (Last Data Updated Time) to identify the server which has the latest data. However, this Last Data Updated Time depends on the operating system's clock.

- Using data on mirror disks

This method is not recommended because the data may be corrupted if anything goes wrong in the procedure. Perform the following steps on both servers to identify which has the latest data.

1. Confirm all groups are stopped.
2. Mount the data partition in the read only mode by referring to "*Forcibly mounting mirror disk when mirroring is not available*".
3. Logically examine the data on the mount point.
4. Unmount the data partition.

Identify the server that holds the latest data and then start forcible mirror recovery by any of the following means:

- Method (1) Using full-scale copy while the group is active

Forcible mirror recovery by this method disables the difference mirror recovery function and instead uses full-scale copy.

If the group stops during forcible mirror recovery, you cannot start the group until forcible mirror recovery is completed. Once forcible mirror recovery completion has been confirmed, the mirror disk can be used by starting the group.

If full-scale copy is performed while the group is active, the system load may be high because forcible mirror recovery must be performed while the group is active.

If the group contains two or more mirror disk resources or hybrid disk resources, these resources must all contain the latest data *on the same server*.

1. Execute the `clpmdctrl` or `clphdctrl` command to start full-scale copy.  
(specify the name of the server containing the latest data and the resource name for command arguments.)

For mirror disk:

```
clpmdctrl --force <server_containing_the_latest_data> <mirror_disk_resource_
↪name (Example: mdl)>
```

For hybrid disk:

```
clphdctrl --force <server_containing_the_latest_data> <hybrid_disk_resource_
↪name (Example: hdl)>
```

2. When mirror recovery is started by the command, the command returns control immediately. Confirm the mirror recovery status and then wait for mirror recovery to complete.
3. When the group is not active, after confirming the completion of mirror recovery, start the group.

- Method (2) Performing full copy while the group is active

With forcible mirror recovery using this method, the difference mirror recovery function is disabled, and full copy is performed instead.

Depending on the file system type, disk usage, and load status, this takes less copying time than the procedures of methods (1) and (3), which are performed in the active state.

Perform this method while the group is stopped. Until forcible mirror recovery is completed, you cannot start the group. Once forcible mirror recovery completion has been confirmed, the mirror disk can be used by starting the group.

If the group contains two or more mirror disk resources or hybrid disk resources, these resources all need to contain the latest data *on the same server*.

1. If the group is active, stop the group.
2. Execute the `clpmdctrl` or `clphdctrl` command to start full-scale copy.  
(Specify the latest data holding server name and resource name in the command argument.)

For mirror disk

```
clpmdctrl --force <server_containing_the_latest_data> <mirror_disk_resource_  
↪name (Example: md1)>
```

For hybrid disk

```
clphdctrl --force <server_containing_the_latest_data> <hybrid _disk _resource_  
↪_ name (Example: hd1)>
```

3. When mirror recovery is started by the command, the command returns control immediately. Confirm the mirror recovery status and then wait for mirror recovery to complete.
4. After confirming the completion of mirror recovery, start the group.

- Method (3) Performing full copy by changing the group from the deactivated state to the active state

With forcible mirror recovery using this method, the difference mirror recovery function is disabled, and full copy is performed instead.

If the group is stopped during forcible mirror recovery, the group cannot be started until forcible mirror recovery is complete. In such a case, once forcible mirror recovery completion has been confirmed, the mirror disk can be used by starting the group.

Note that, because forcible mirror recovery is performed concurrently while the group is active, the system load may be high.

If the group contains two or more mirror disk or hybrid disk resources, these resources must all contain the latest data *on the same server*.

1. While the group is not active, suspend the mirror disk monitor resource or the hybrid disk monitor resource being used to monitor a mirror disk resource or a hybrid disk resource.

On each server, execute the command below.

This causes auto-mirror recovery to be temporarily unavailable.

```
clpmonctrl -s -m <relevant_monitor_resource_name (example: mdw1)>
```

(To suspend a monitor resource by using Cluster WebUI instead of the command, click the relevant mirror disk monitor resource or hybrid disk monitor resource, and then execute **Suspend monitor**. In the confirmation window, select **Suspend**. The monitor will enter the "suspended" state.)

2. **On the server holding the latest data**, execute the clpmdctrl or clphdctrl command to change the mirror disk status of the relevant server to the latest status.

(Do not specify the latest data holding server name in the command argument.)

For mirror disk

```
clpmdctrl --force <mirror_disk_resource_name (Example: md1)>
```

For hybrid disk

```
clphdctrl --force <hybrid_disk_resource_name (Example: hd1)>
```

3. Confirm that the relevant mirror disk resource and hybrid disk resource have entered the latest status (Normal) by using the Cluster WebUI, clpmdstat command, or clphdstat command.  
After confirming the status, start the relevant group **on the server holding the latest data** using the clpgrp command or Cluster WebUI.
4. Upon the completion of group start, execute the clpmdctrl or clphdctrl command to start full copy.  
(specify the name of the server containing the latest data and the resource name for command arguments.)

For mirror disk :

```
clpmdctrl --force <server_containing_the_latest_data> <mirror_disk_resource_
↪name (Example: md1)>
```

For hybrid disk :

```
clphdctrl --force <server_containing_the_latest_data> <hybrid_disk_resource_
↪name (Example: hd1)>
```

5. When you start mirror recovery with the command, the command will return control immediately. Then, return the suspended monitor resource to its original state. On each server, execute the following command.

```
clpmonctrl -s -m <relevant_monitor_resource_name (example: mdw1)>
```

(To resume a monitor resource by using Cluster WebUI instead of the command, click the relevant mirror disk monitor resource or hybrid disk monitor resource, and then execute **Resume monitor**. In the confirmation window, select **Resume**.)

- Method (4) Using auto mirror recovery and difference mirror recovery

If difference mirror recovery is possible, perform recovery using the difference information.

Since mirror recovery is performed while the group is activated, the system load may be high.

If the group contains two or more mirror disk resources or hybrid disk resources, these resources all need to hold the latest data **on the same server**.

1. **On the server holding the latest data**, execute the clpmdctrl or clphdctrl command to change the mirror disk status of the relevant server to the latest status.  
(Do not specify the latest data holding server name in the command argument.)

For mirror disk

```
clpmdctrl --force <mirror_disk_resource_name (Example: md1)>
```

For hybrid disk

```
clphdctrl --force <hybrid_disk_resource_name (Example: hd1)>
```

2. When the group is not active, confirm that the relevant mirror disk resource and hybrid disk resource have entered the latest status (Normal) by using the Cluster WebUI, clpmdstat command, or clphdstat command.

After confirming the status, start the relevant group **on the server holding the latest data** using the clpgroup command or Cluster WebUI.

3. When the group is not active, auto mirror recovery starts after the relevant group starts (after activation). When the group is active, auto mirror recovery starts after the operation in 1.

If auto mirror recovery is not started because, for example, **Auto Mirror Recovery** is cleared, use the clpmdctrl or clphdctrl command or Cluster WebUI to start mirror recovery manually.

For mirror disk

```
clpmdctrl --recovery <mirror_disk_resource_name (Example: md1)>
```

For hybrid disk

```
clphdctrl --recovery <hybrid_disk_resource_name (Example: hd1)>
```

The `clpmdctrl` or `clphdctrl` command immediately returns control once mirror recovery starts. For information on how to check the mirror recovery progress, see "Checking the mirror recovery progress with a command" and "Checking the mirror recovery progress from the Cluster WebUI".

### 10.1.21 Running the forcible mirror recovery with a command only on one server

In some cases, you cannot start one of the servers due to a hardware or OS failure, and the server that can be started may not have the latest data. If you want to start applications at least on the server that can be started, you can perform the forcible mirror recovery on that server.

However, remember that if you do this, the data on the server where you run this command becomes the latest data no matter which server actually has it. Therefore, even if you are able to start the other server later, you cannot handle the data in that server as the latest one. Make sure you understand the consequence before running the following command.

Run the following command to start the forcible mirror recovery:

For mirror disk:

```
clpmdctrl --force <mirror_disk_resource_name (Example: md1)>
```

For hybrid disk:

```
clphdctrl --force <hybrid_disk_resource_name (Example: hd1)>
```

After running the command, you can activate the groups and use the mirror disks or hybrid disks.

### 10.1.22 Checking the mirror break status from the Cluster WebUI

You can see the mirror break status by using the Cluster WebUI.

(The following is an example of mirror disk resource. What the statuses mean and description are the same for hybrid disk resources, although the screen display is different.)

- When normal:

| Mirror disks     |                        |                      |                 |             |          |        |             |          |        |
|------------------|------------------------|----------------------|-----------------|-------------|----------|--------|-------------|----------|--------|
| Mirror disk name | ▲ Synchronization mode | Synchronization Data | Difference copy | Server name | Active   | Status | Server name | Active   | Status |
| ▼ md1            | Synchronous            | On                   | --              | server1     | Inactive | Normal | server2     | Inactive | Normal |

- When mirror recovery is required:

| Mirror disks     |                        |                      |                 |             |        |        |             |          |          |
|------------------|------------------------|----------------------|-----------------|-------------|--------|--------|-------------|----------|----------|
| Mirror disk name | ▲ Synchronization mode | Synchronization Data | Difference copy | Server name | Active | Status | Server name | Active   | Status   |
| ▼ md1            | Synchronous            | On                   | Possible        | server1     | Active | Normal | server2     | Inactive | Abnormal |

- When forcible mirror recovery is required:

| Mirror disks     |                      |                      |                 |             |          |          |             |          |          |
|------------------|----------------------|----------------------|-----------------|-------------|----------|----------|-------------|----------|----------|
| Mirror disk name | Synchronization mode | Synchronization Data | Difference copy | Server name | Active   | Status   | Server name | Active   | Status   |
| ▼ md1            | Synchronous          | On                   | Impossible      | server1     | Inactive | Abnormal | server2     | Inactive | Abnormal |

- While mirror recovery is in progress:

See "*Checking the mirror recovery progress from the Cluster WebUI*".

### 10.1.23 Checking the mirror recovery progress from the Cluster WebUI

Click **Mirror disks** tab on the Cluster WebUI to view the mirror recovery progress. (The following is an example of mirror disk resource. What the statuses mean and description are the same for hybrid disk resources, although the screen display is different.)

You will see the following screen during the mirror recovery.

| Mirror disks     |                      |                      |                 |                                                                                     |          |            |             |          |            |
|------------------|----------------------|----------------------|-----------------|-------------------------------------------------------------------------------------|----------|------------|-------------|----------|------------|
| Mirror disk name | Synchronization mode | Synchronization Data | Difference copy | Server name                                                                         | Active   | Status     | Server name | Active   | Status     |
| ▲ md1            | Synchronous          | On                   | --              | server1                                                                             | Inactive | Recovering | server2     | Inactive | Recovering |
|                  |                      |                      |                 |   |          |            |             |          |            |
|                  |                      |                      |                 |  |          |            |             |          |            |

You will see the following screen when the mirror recovery is successfully completed.

| Mirror disks     |                      |                      |                 |                                                                                     |          |        |             |          |        |
|------------------|----------------------|----------------------|-----------------|-------------------------------------------------------------------------------------|----------|--------|-------------|----------|--------|
| Mirror disk name | Synchronization mode | Synchronization Data | Difference copy | Server name                                                                         | Active   | Status | Server name | Active   | Status |
| ▲ md1            | Synchronous          | On                   | --              | server1                                                                             | Inactive | Normal | server2     | Inactive | Normal |
|                  |                      |                      |                 |  |          |        |             |          |        |
|                  |                      |                      |                 |  |          |        |             |          |        |

### 10.1.24 Recovering mirror using the Cluster WebUI

Click **Mirror disks** tab of the ClusterWebUI and display the detailed data of the mirror disk resources you want to start mirror recovery. For information on the **Mirror disks** tab, see the online manual of the Cluster WebUI.

For information on how to check the mirror recovery progress, see "*Checking the mirror recovery progress with a command*" and "*Checking the mirror recovery progress from the Cluster WebUI*".

### 10.1.25 Running the forcible mirror recovery using the Cluster WebUI

When EXPRESSCLUSTER cannot determine which server has the latest data, you have to perform the forcible mirror recovery.

In this case, you have to manually identify the server which holds the latest data, and perform the forcible mirror recovery.

Identify the server that has the latest data by any of the following methods:

- Using Cluster WebUI
  1. On the screen of the **Mirror disks** tab of the Cluster WebUI, display the detailed data of the mirror disk resources you want to see.
  2. Click **Details** icon.
  3. See the last update time stamp (Last Data Updated Time) to identify the server which has the latest data. However, this Last Data Updated Time depends on the operating system's clock.
- Using the clpmdstat command or clphdstat command

Confirm method is the same as Cluster WebUI except that you use a command.

1. Run the following command:

For mirror disk:

```
clpmdstat --mirror <mirror_disk_resource_name (Example: mdl)>
```

For hybrid disk:

```
clphdstat --mirror <hybrid_disk_resource_name (Example: hd1)>
```

2. See the last update time stamp (Last Data Updated Time) to identify the server which contains the latest data. However, this Last Data Updated Time depends on the operating system's clock.

- Using data on mirror disks

This is not recommended because the data may be corrupted destroyed if anything goes wrong in the procedure. Perform the following steps on both servers to identify which has the latest data.

1. Confirm that all groups are inactive.
2. See "*Forcibly mounting mirror disk when mirroring is not available*".
3. Logically examine the data on the mount point.
4. Unmount the data partition.

When you have identified the server containing the latest data, start the forcible mirror recovery from the **Mirror disks** tab of the Cluster WebUI. For information on the **Mirror disks** tab, see the online manual of the Cluster WebUI.

Start forcible mirror recovery using any of the following methods:

- Method (1) Using full-scale copy

Forcible mirror recovery by this method disables the difference mirror recovery function and instead uses full-scale copy.

Note that the group cannot be started until forcible mirror recovery is complete. Once forcible mirror recovery completion has been confirmed, the mirror disk can be used by starting the group.

1. In the **Mirror disks** tab, select **Full copy** icon to execute full-scale copy from the server holding the latest data to the copy destination server and then start mirror recovery.

(When the group has already been started, **Full copy** icon cannot be selected from the **Mirror disks**. In this case, stop the group, or perform forcible mirror recovery with the relevant command.)

2. After confirming the completion of mirror recovery, start the group.

- Method (2) Using auto mirror recovery and difference mirror recovery

If difference mirror recovery is possible, perform recovery using the difference information. The mirror recovery takes less time than when the forcible mirror recovery is performed (FastSync technology).

Because mirror recovery is performed while the group is activated, the system load may be high.

If the group contains two or more mirror disk resources or hybrid disk resources, these resources all need to hold the latest data **on the same server**.

1. In the **Mirror disks** tab, select **Mirror recovery** icon to change the mirror disk status of **the server holding the latest data** from Abnormal to Normal.

(When the group has already been started, this **Mirror recovery** operation cannot be executed from the **Mirror disks**. In this case, stop the group, or perform forcible mirror recovery with the relevant command.)

2. Confirm that the relevant mirror disk resource and hybrid disk resource have entered the latest status (Normal).

After confirming the status, start the relevant group **on the server holding the latest data**.

3. After the relevant group starts (after activation), auto mirror recovery starts.

If difference mirror recovery is possible, it is performed.

If difference mirror recovery is impossible, full-scale copy is performed.

If auto mirror recovery is not started such as the auto mirror recovery is OFF, start the mirror recovery manually from the **Mirror disks**.

For information on how to check the forcible mirror recovery progress, see "*Checking the mirror recovery progress with a command*" and "*Checking the mirror recovery progress from the Cluster WebUI*".

## 10.1.26 Running the forcible mirror recovery from the Cluster WebUI only on one Server

In some cases, you cannot start one of the servers due to a hardware or OS failure, and the server that can be started may not have the latest data.

If you want to start applications at least on the server that can be started, you can perform the forcible mirror recovery on that server.

However, remember that if you do this, the data on the server where you run this command becomes the latest data regardless of which server actually contains the data. Therefore, even if the other server becomes available later, you cannot handle the data in that server as the latest one. Make sure you understand the consequence before running the following command.

Start the forcible mirror recovery from the **Mirror disks** tab of Cluster WebUI. For information on the **Mirror disks** tab of the Cluster WebUI, see the online manual of the Cluster WebUI.

When the forcible mirror recovery is successfully completed, you can activate the groups and use the mirror disks.

### 10.1.27 Changing current server on hybrid disk

Conditions in which current server can be changed is as follows:

| Hybrid disk status  |                     | Whether or not current server can be changed |                |
|---------------------|---------------------|----------------------------------------------|----------------|
| Server group 1      | Server group 2      | Server group 1                               | Server group 2 |
| error/deactivated   | error/deactivated   | Yes                                          | Yes            |
| normal/deactivated  | error/deactivated   | Yes                                          | Yes            |
| error/deactivated   | normal/deactivated  | Yes                                          | Yes            |
| normal/deactivated  | normal/deactivated  | Yes                                          | Yes            |
| normal/activated    | error/deactivated   | No                                           | Yes            |
| error/deactivated   | normal/activated    | Yes                                          | No             |
| normal/activated    | normal/deactivated  | No                                           | No             |
| pending/deactivated | pending/deactivated | Yes                                          | Yes            |

### 10.1.28 Changing current server with a command

Run the following command on the server which you want to make current server to change the current server of hybrid disk.

```
clphdctrl --setcur <hybrid_disk_resource_name (Example:hd1)>
```

### 10.1.29 Changing current server with Cluster WebUI

For information on the Mirror disks tab of Cluster WebUI, see the online manual of the Cluster WebUI.

## 10.2 Troubleshooting problems with VERITAS volume manager

This section describes how to handle trouble when using VERITAS volume manager.

### 10.2.1 Modifying the VERITAS volume manager configuration

Whether or not the OS needs to be restarted determines the steps for changing the VERITAS Volume Manager configuration.

- If the OS does not need to be restarted when changing the configuration, see "When the OS does not need to be restarted to change the configuration of VERITAS Volume Manager".
- If the OS needs to be restarted when changing the configuration, see "When restart of the OS is necessary to change the configuration of VERITAS Volume Manager".

#### When the OS does not need to be restarted to change the configuration of VERITAS Volume Manager

1. Connect to the Cluster WebUI with a management IP address. If you do not have any management IP address, connect to it by using the actual IP address of any server.
2. On the Cluster WebUI, click **Stop Cluster** icon.
3. Change the configuration of VERITAS Volume Manager.
4. Change the settings of the resource in the **Config mode** of Cluster WebUI.
5. Upload the cluster configuration data in the **Config mode** of Cluster WebUI.
6. In the **Operation mode** of Cluster WebUI, click **Start Cluster** icon.

The settings will be effective.

#### When restart of the OS is necessary to change the configuration of VERITAS Volume Manager

1. Back up the cluster configuration data. Choose Step A or B depending on the type of OS that uses the Cluster WebUI.
  - Run the command below to make a backup of the Cluster WebUI which operates on the Web browser of Linux.

```
clpcfctrl --pull -l -x <path of configuration data file>
```

- Run the command below to make a backup of the Cluster WebUI which operates on the Web browser of Windows.

```
clpcfctrl --pull -w -x <path of configuration data file>
```

For information on troubleshooting clpcfctrl problems, see "*Changing, backing up, and checking cluster configuration data (clpcfctrl command)*" in "9.2. EXPRESSCLUSTER commands" in this guide.

2. Set the EXPRESSCLUSTER services not to start on all servers.

#### For systemd environment:

```
clpsvcctrl.sh --disable core
```

3. Stop the EXPRESSCLUSTER daemon.

```
clpcl -t -a
```

4. Change the configuration of VERITAS Volume Manager, and restart the OS.

5. Change the settings of resources in the **Config mode** of Cluster WebUI.
6. Upload the cluster configuration data in the **Config mode** of Cluster WebUI.
7. Set the EXPRESSCLUSTER services to start on all servers.

```
clpsvcctrl.sh --enable core
```

8. Restart all servers.

The services will be effective next time the OS is started.

## 10.2.2 Operations of EXPRESSCLUSTER when VERITAS volume manager fails

See procedures in "To change the cluster configuration data," if you do not wish to failover groups or the final action to take place when a problem occurs in VERITAS Volume Manager and an error is detected in the disk resource and/or VxVM volume manager resource.

See procedures in "Restoring the cluster configuration information," if you wish to recover from a VERITAS Volume Manager error and to establish control again by using the EXPRESSCLUSTER.

### To change the cluster configuration data

1. Start all servers at run level 1.
2. Set the EXPRESSCLUSTER services not to start on all servers

```
clpsvcctrl.sh --disable core
```

3. Restart all servers.
4. Make a backup of the cluster configuration data. Choose Step A or B depending on the type of OS that uses the Cluster WebUI.

- Run the command shown below to make a backup of the Cluster WebUI which operates on the Web browser of Linux.

```
clpcfctrl --pull -l -x <path of configuration data file>
```

- Run the command below to make a backup of the Cluster WebUI which operates on the Web browser of Windows.

```
clpcfctrl --pull -w -x <path of configuration data file>
```

For information on troubleshooting clpcfctrl problems, see "*Changing, backing up, and checking cluster configuration data (clpcfctrl command)*" in "9.2. EXPRESSCLUSTER commands" in this guide.

5. Change the settings of resources in the **Config mode** of Cluster WebUI.

- disk resource
- VxVM volume manager resource

For these group resources, make the following settings on the **Recovery operation** tab of the **Resource Properties** window:

- Recovery operation at activation failure
  - Retry Count at Activation Failure 0 time
  - Failover Threshold 0 time
  - Final Action No Operation (Next Resource Are Activated)

- Recovery operation at deactivation failure
  - Retry Count at Deactivation Failure 0 time
  - Final Action No Operation (Next Resource Are Deactivated)
- VxVM volume manager monitor resource
- disk monitor resource

For these monitor resources, make the following settings on the **Recovery Action** tab of the **Monitor Resources Properties** window:

- Error Detection
    - Recovery Action Execute only the final action
    - Final Action No Operation
6. Upload the cluster configuration data in the **Config mode** of Cluster WebUI.
  7. Set the EXPRESSCLUSTER services to start on all servers.

```
clpsvcctl.sh --enable core
```

8. Restart all servers.

The services will be effective next time the OS is started.

#### Restoring the cluster configuration information

1. Stop the EXPRESSCLUSTER daemon using the command shown below if the EXPRESSCLUSTER daemon is running.

```
clpcl -t -a
```

2. Load the configuration information created in Step 5 of "To change the cluster configuration data" to the server. Choose Step A or B depending on the version of the configuration data that you backed up.

```
clpcfctrl --push -x <path of configuration data file>
```

For information on troubleshooting clpcfctrl problems, see "*Changing, backing up, and checking cluster configuration data (clpcfctrl command)*" in "9.2. EXPRESSCLUSTER commands" in this guide.

The setting will be effective next time the EXPRESSCLUSTER daemon is started.

## 10.3 To confirm the progress of the fsck / xfs\_repair command

Fsck or xfs\_repair carried out when activating a disk resource, a mirror disk resource and a hybrid disk resource may needs long time by completion by the size of the partition and the state of the file system.

It's possible to refer to the following logfile for progress of the fsck or xfs\_repair command a disk resource, a mirror disk resource and a hybrid disk resource issued and check it:

| Resource type        | Log file          |
|----------------------|-------------------|
| Disk resource        | disk_fsck.log.cur |
| Mirror disk resource | md_fsck.log.cur   |
| Hybrid disk resource | hd_fsck.log.cur   |

## ERROR MESSAGES

This chapter provides information on error messages you might encounter in operating EXPRESSCLUSTER.

This chapter covers:

- 11.1. *Messages*
- 11.2. *Messages reported by syslog, alert, mail, SNMP trap, and Message Topic*
- 11.3. *Driver syslog messages*
- 11.4. *Detailed information in activating and deactivating group resources*
- 11.5. *Detailed info of monitor resource errors*
- 11.6. *JVM monitor resource log output messages*
- 11.7. *Details on checking cluster configuration data*

## **11.1 Messages**

EXPRESSCLUSTER X 5.0 does not support event log (syslog) monitoring of NEC ESMPRO Agent.

EXPRESSCLUSTER X 5.0 does not notify events occurring on EXPRESSCLUSTER to NEC Express Report Service.

## 11.2 Messages reported by syslog, alert, mail, SNMP trap, and Message Topic

If the "o" mark is shown in the alert column or the syslog column, the message on that row is output to the Alert logs of the Cluster WebUI or syslog of OS, respectively.

If the "o" mark is shown in the mail column, the message on that row is reported when E-mail report function of Alert Service is enabled.

If the "o" mark is shown in the SNMP Trap column, the message on that row is reported when SNMP trap sending function of Alert Service is enabled.

For details of E-mail report and SNMP trap sending, see "*Alert Service tab*" in "*2. Parameter details*" and "*Alert Service*" in "*Information on other settings*".

If the "o" mark is shown in the Message Topic column, the message on that row is reported when Amazon SNS linkage function is enabled.

For details of Amazon SNS linkage function, see "*2. Parameter details*" - "*2.2. Cluster properties*" - "*2.2.19. Cloud tab*".

**Note:** facility = daemon (0x00000018), identity = "expresscls" are displayed on syslogs. The "Event type" on the following list is the log level of the syslog.

In the table below, each number indicates the following:

[1]alert, [2]syslog, [3]Mail Report, [4]SNMP Trap, [5]Message Topic

| Module type | Event type | Event ID | Message                                          | Description                                                  | Solution                                                                                                                                      | 1 | 2 | 3 | 4 | 5 |

|-------------|------------|----------|---------------------------------------------------|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| liscal      | Error      | 322      | NMP%d failed to write a history file. (%1)        | The history file was not written.                       | Execute the after-mentioned coping process <sup>1</sup> (coping process to lack of resource) when the lack of resource is possible. The OS may have become unstable. Restart the system. The partition of the history file directory may not have enough free space. Maintain enough free space. The physical defect may have occurred with the disk of the history file directory in case of being output while in operation. Change the settings of the history file directory or replace the disk. |
| liscal      | Error      | 323      | NMP%d failed to write a history file. (overflow)  | The total size reached the maximum of the history file. | <ul style="list-style-type: none"> <li>• Check the mirror disk connection status. Check if the mirror disk connection or OS is highly-loaded.</li> <li>• Check that the setting of the history file capacity is not too small.</li> </ul>                                                                                                                                                                                                                                                             |
| liscal      | Error      | 324      | NMP%d failed to delete a history file. (%1)       | The history file was not deleted.                       | Check that the history file directory or the file in it has been used by any other application.                                                                                                                                                                                                                                                                                                                                                                                                       |
| liscal      | Error      | 330      | NMP%d Internal error. (%1)                        | Internal error.                                         | A problem may have occurred with the mirror driver. Restart the system.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| liscal      | Info       | 331      | --- Previous liscal message repeated %1 times --- | The last message was output consecutively %1 times.     | -                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

<sup>1</sup> coping process 1 coping process to lack of resource

The physical memory may be running short.  
Add more physical memory or stop unnecessary applications.

The upper limit of I/O request queue number ensured by the mirror driver may be too big.  
In case that a massive amount of I/O over transaction performance are requested to the mirror disk, the kernel memory is used because the I/O requests are queued in the mirror driver.  
Decrease the maximum number of the request queue in "Mirror Driver" tab of "Cluster Properties" by seeing " [2. Parameter details](#)" in this guide.

The file system may ensure a massive amount of the cache.  
In case that a massive amount of I/O over transaction performance are requested, the memory zone for kernel space may be used for the file system cache in addition to the cache and the memory zone for user space.  
In that case, as a workaround, keep the memory zone for kernel space used by the driver from being utilized as the cache by setting /proc/sys/vm/lower\_zone\_protection.  
See "Cache swell by a massive I/O" in "Notes and Restrictions" in the "Getting Started Guide".

<sup>2</sup> coping process 2 Parameters

| Parameter names output in log | Setting Item Names in the Cluster WebUI       | Positions of Setting Items in the Cluster WebUI             |
|-------------------------------|-----------------------------------------------|-------------------------------------------------------------|
| Bitmap refresh interval       | Bitmap Refresh Interval (bpchkinterval)       | Cluster Properties<br>Mirror Driver tab                     |
| max_cachenum                  | (maxcache)                                    | (In the configuration file)                                 |
| send_queue_size               | The number of queues (sendqueuesize)          | Mirror Disk Resource Tuning Properties<br>Mirror tab        |
| band_limit_mode               | Rate limitation of Mirror Connect (mode)      | Same as above.                                              |
| band_limit                    | Rate limitation of Mirror Connect (bandlimit) | Same as above.                                              |
| ack_timeout                   | Ack Timeout (acktimeout)                      | Mirror Disk Resource Tuning Properties<br>Mirror Driver tab |

Table 11.6 – continued from previous page

| Parameter names output in log | Setting Item Names in the Cluster WebUI | Positions of Setting Items in the Cluster WebUI |
|-------------------------------|-----------------------------------------|-------------------------------------------------|
| connect_timeout               | Connection Timeout<br>(connecttimeout)  | Same as above.                                  |
| send_timeout                  | Send Timeout<br>(sendtimeout)           | Same as above.                                  |
| receive_normal_timeout        | Receive Timeout<br>(recvnormaltimeout)  | Same as above.                                  |
| hb_interval                   | Heartbeat Interval<br>(hbinterval)      | Same as above.                                  |
| hb_recv_timeout               | ICMP Receive Timeout<br>(pingtimeout)   | Same as above.                                  |
| hb_recv_retry                 | ICMP Retry Count<br>(pingretry)         | Same as above.                                  |
| keepalive_time                | (keepalive/timeout)                     | (In the configuration file)                     |
| keepalive_probe               | (keepalive/prob)                        | Same as above.                                  |
| keepalive_interval            | (keepalive/interval)                    | Same as above.                                  |
| lastupdate_delay              | (lupdatedelay)                          | Same as above.                                  |

For the details of each parameter, see the following chapters in this Guide.

- "[Cluster properties](#)" in "[2. Parameter details](#)"
- "[Understanding Mirror disk resources](#)" and "[Understanding Hybrid disk resources](#)" in "[3. Group resource details](#)"
- "[Adjusting time-out temporarily \(clptoratio command\)](#)" in "[9. EXPRESSCLUSTER command reference](#)"

<sup>3</sup> coping process 3 For the details of the ports used by the mirror driver, see the following.

- "Connection port number" in "Notes and Restrictions" in the "Getting Started Guide"
- "Changing the range of automatic allocation for the communication port numbers" in "Notes and Restrictions" in the "Getting Started Guide"
- "[Understanding mirror parameters](#)" of "[3. Group resource details](#)" in the "Reference Guide"
- "Mirror driver tab" of "[3. Group resource details](#)" in the "Reference Guide"
- "Communication ports" of "The system maintenance information" in the "Maintenance Guide"

- "Settings after configuration hardware" of "Determining a system configuration" in the "Installation and Configuration Guide"

<sup>4</sup> coping process 4 Timeout parameters of mirror

| Setting Item Names in<br>the Cluster WebUI | Positions of Setting Items<br>in the Cluster WebUI |
|--------------------------------------------|----------------------------------------------------|
| Recovery Data Size                         | Cluster Properties<br>Mirror Agent tab             |
| Ack Timeout                                | Mirror Disk Resource Tuning Properties             |
| Connection Timeout<br>Mirror Driver tab    | Same as above.                                     |
| Send Timeout                               | Same as above.                                     |
| Receive Timeout                            | Same as above.                                     |

For the details of each parameter, see the following chapters in this guide.

- "*Cluster properties*" in "*2. Parameter details*"
- "*Understanding Hybrid disk resources*" and "*Understanding Hybrid disk resources*" in "*3. Group resource details*"
- "*Adjusting time-out temporarily (clptoratio command)*" in "*9. EXPRESSCLUSTER command reference*"

### 11.3.2 Kernel mode LAN heartbeat driver

| Module Type | Event type | Event ID | Message                                                             | Description                                                    | Solution |

| Module Type | Event type | Event ID | Message                                | Description                                                                          | Solution                                                                                          |
|-------------|------------|----------|----------------------------------------|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| clpka       | Error      | 140      | Reference an inaccessible memory area! | Passing the version information of the clpka driver to the cluster main body failed. | Check if the installed clpka driver is legitimate.                                                |
| clpka       | Error      | 141      | Failed to allocate memory!             | The size of physical memory is not sufficient.                                       | The physical memory is running out. Add physical memories, or terminate unnecessary applications. |
| clpka       | Error      | 142      | Invalid argument, %1!                  | Invalid information was passed from the cluster main body to the clpka driver.       | Check if the installed clpka driver is legitimate.                                                |
| clpka       | Error      | 144      | Process (PID=%1) is not set.           | A process other than cluster main body tried operation to the clpka driver.          | Check if there is any application trying to access to the clpka driver erroneously.               |

## 11.4 Detailed information in activating and deactivating group resources

### 11.4.1 Floating IP resources

| Module type | Type  | Return value | Message                                 | Description                                                  | Solution                                                                      |
|-------------|-------|--------------|-----------------------------------------|--------------------------------------------------------------|-------------------------------------------------------------------------------|
| fip         | Error | 3            | Command failed. (%1, ret=%2)            | Failed in executing the command %1. The return value is %2.  | Analyze the failure from the return value of the command.                     |
| fip         | Error | 11           | Command failed. (%1(%2), errno=%3)      | An error has occurred in executing the command.              | Memory or OS resources may not be sufficient. Check them.                     |
| fip         | Error | 14           | IP address did not exist.               | Failed to get the IP address list.                           | Confirm that the OS can use the TCP/IP protocol.                              |
| fip         | Error | 15           | IP address was already used.            | The IP address is already used.                              | Check the IP address is not already used.                                     |
| fip         | Error | 15           | This ip address was already used. IP=%1 | The specified IP address exists on the same network.         | Check if the specified IP address is not used on the network.                 |
| fip         | Error | 17           | Fip interface was not found.            | Floating IP address interface was not found.                 | Check if the FIP address network is the same as the server's real IP address. |
| fip         | Error | others       | Internal error. (status=%1)             | An error other than the errors mentioned above has occurred. | Memory or OS resources may not be sufficient. Check them.                     |

### 11.4.2 Virtual IP resource

| Module type | Type  | Return value | Message                                 | Description                                                 | Solution                                                              |
|-------------|-------|--------------|-----------------------------------------|-------------------------------------------------------------|-----------------------------------------------------------------------|
| vip         | Error | 3            | Command failed. (%1, ret=%2)            | Failed in executing the command %1. The return value is %2. | Analyze the failure from the return value of the command.             |
| vip         | Error | 11           | Command failed. (%1(%2), errno=%3)      | An error has occurred in executing the command.             | Memory or OS resources may not be sufficient. Check them.             |
| vip         | Error | 14           | IP address did not exist.               | Failed to acquire the list of IP addresses.                 | Check the OS is in the environment that supports the TCP/IP protocol. |
| vip         | Error | 15           | IP address was already used.            | The IP address is already used.                             | Check if the IP address is not already used.                          |
| vip         | Error | 15           | This ip address was already used. IP=%1 | The specified IP address exists on the same network.        | Check if the specified IP address is not already used on the network. |

Table 11.11 – continued from previous page

| Module type | Type  | Return value | Message                      | Description                            | Solution                                                  |
|-------------|-------|--------------|------------------------------|----------------------------------------|-----------------------------------------------------------|
| vip         | Error | 17           | Vip interface was not found. | The specified interface was not found. | Check if the specified interface exists on the server.    |
| vip         | Error | Others       | Internal error. (status=%1)  | Other internal error was occurred.     | Memory or OS resources may not be sufficient. Check them. |

### 11.4.3 Disk resources

| Module type | Type  | Return value | Message                                  | Description                                                                                | Solution                                                                                            |
|-------------|-------|--------------|------------------------------------------|--------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| disk        | Error | 1            | Resource name was invalid. (%1)          | The resource name is invalid.                                                              | Check the resource name is consistent with the information in the cluster configuration data.       |
| disk        | Error | 1            | Group name was invalid. (%1)             | The group resource name is invalid.                                                        | Check the group name is consistent with the information in the cluster configuration data.          |
| disk        | Error | 1            | Resource was not in config. (%1)         | The resource name does not exist in the cluster configuration data.                        | Check the resource name is consistent with the information in the cluster configuration data.       |
| disk        | Error | 1            | Group was not in config. (%1)            | The group resource name does not exist in the cluster configuration data.                  | Check the group resource name is consistent with the information in the cluster configuration data. |
| disk        | Error | 1            | Getting of config was failed.            | Failed to obtain the cluster configuration data.                                           | Check the cluster configuration data exists.                                                        |
| disk        | Error | 1            | Mount point was already mounted. (%1)    | The device has already been mounted.                                                       | Check if the specified device is unmounted.                                                         |
| disk        | Error | 1            | Mount point was not mounted. (%1)        | The mount point was not mounted.                                                           | An active resource may have been manually unmounted. Check its status.                              |
| disk        | Error | 1            | Mount point was invalid. (%1)            | The mount point is invalid.                                                                | Check the mount point exists.                                                                       |
| disk        | Error | 1            | Creating of mount point was failed. (%1) | Failed to create the mount point.                                                          | Memory or OS resources may not be sufficient. Check them.                                           |
| disk        | Error | 1            | Raw device was already bound. (%1)       | The RAW device has already been bound by another device.                                   | Check if the unique raw device is set in the cluster.                                               |
| disk        | Error | 1            | Max recover retry over. (%1, retry=%2)   | The number of retries made for activating the device has exceeded the maximum retry count. | Check the cluster configuration data is correct.                                                    |

Check them.                                                                                                                                                                  |
| ocvip       | Error | 8            | Failed to stop the port %1 control process.      | Stopping the port %1 control process failed.     | Memory or OS resources may not be sufficient. Check them. Restart OS.                                                                                                                                                      |
| ocvip       | Error | 9            | The port %1 control process has already started. | The port %1 control process has already started. | Memory or OS resources may not be sufficient. Check them. Or, the immediately preceding deactivation may have failed. In that case, stop the cluster and forcibly terminate the port control process (clpocvipp) manually. |
| ocvip       | Error | 10           | Failed to start the port %1 control process.     | Starting the port %1 control process failed.     | Memory or OS resources may not be sufficient. Check them.                                                                                                                                                                  |
| ocvip       | Error | 99           | Internal error. (status=%1)                      | Internal error occurred.                         | Memory or OS resources may not be sufficient. Check them.                                                                                                                                                                  |

## 11.5 Detailed info of monitor resource errors

### 11.5.1 IP monitor resources

| Module Type | Type    | Return value   | Message                               | Description                                                  | Solution                                                                                                                            |
|-------------|---------|----------------|---------------------------------------|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| ipw         | Error   | 5              | Ping was failed by time-out. IP=%s... | The ping command failed due to timeout.                      | The system may be heavily loaded, memory or OS resources may not be sufficient. Check them.                                         |
| ipw         | Error   | 31             | Ping cannot reach. (ret=%1) IP=%2...  | The packet by the ping command did not reach.                | Check if you can ping the IP address. If you fail, check the status of the device that has the IP address or the network interface. |
| ipw         | Warning | 102            | Ping was failed. (ret=%1) IP=%2...    | The ping command failed.                                     | Memory or OS resources may not be sufficient. Check them.                                                                           |
| ipw         | Warning | 106<br>108~121 | Internal error. (status=%1)           | An error other than the errors mentioned above has occurred. | Memory or OS resources may not be sufficient. Check them.                                                                           |
| ipw         | Warning | 189            | Internal error. (status=%1)           | Monitoring of the IP monitor resource failed by time out.    | Memory or OS resources may not be sufficient. Check them.                                                                           |

### 11.5.2 Disk monitor resources

| Module Type | Type  | Return value | Message                                                                        | Description                                                  | Solution                                                                                                                                                                                                                     |
|-------------|-------|--------------|--------------------------------------------------------------------------------|--------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| diskw       | Error | 12           | Ioctl was failed. (err=%1) Device=%2                                           | Failed to control the device.                                | Check the disk to be monitored is properly connected, powered on, or does not have any problem.                                                                                                                              |
| diskw       | Error | 14           | 1. Open was failed. (err=%1) File=%2<br>2. Open was failed. (err=%1) Device=%2 | 1. Opening the file failed.<br>2. Opening the device failed. | Check if there is a directory whose name is similar to the file name, the disk to be monitored is properly connected, powered on, or does not have any problem.<br>Memory or OS resources may not be sufficient. Check them. |

Specify a normal file.                                                                                                                        |
| diskw       | Warning | 190          | Device was invalid. Device=%1           | The specified real device is invalid.                        | Check the device name of the disk monitor resource on the Cluster WebUI.                                                                                                                           |
| diskw       | Warning | 191          | Ignored disk full error.                | A disk full error has been ignored.                          | Check the usage of the device.                                                                                                                                                                     |

### 11.5.3 PID monitor resources

| Module Type | Type    | Return value | Message                          | Description                                                  | Solution                                                         |
|-------------|---------|--------------|----------------------------------|--------------------------------------------------------------|------------------------------------------------------------------|
| pidw        | Error   | 1            | Process does not exist. (pid=%1) | The process does not exist.                                  | The process to be monitored disappeared for some reason.         |
| pidw        | Warning | 100          | Resource %1 was not found.       | The resource is not found.                                   | Check the cluster configuration data by using the Cluster WebUI. |
| pidw        | Warning | 100          | Internal error. (status=%1)      | An error other than the errors mentioned above has occurred. | Memory or OS resources may not be sufficient. Check them.        |

### 11.5.4 User mode monitor resources

| Module Type | Type  | Return value | Message                | Description                                           | Solution                                                                                                                                                     |
|-------------|-------|--------------|------------------------|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userw       | Error | 1            | Initialize error. (%1) | An error was detected while initializing the process. | Check if the driver depended on by the User mode monitor resources exist, or the rpm is installed. The driver or rpm differ depending on the monitor method. |

### 11.5.5 Custom monitor resource

| Module Type | Type  | Return value | Message                           | Description                                          | Solution                                                   |
|-------------|-------|--------------|-----------------------------------|------------------------------------------------------|------------------------------------------------------------|
| genw        | Error | 1            | Initialize error. (status=%d)     | An error was detected while initialization.          | Memory or OS resources may not be sufficient. Check them.  |
| genw        | Error | 2            | Termination code %d was returned. | An unexpected value was returned.                    | Check if the cluster configuration information is correct. |
| genw        | Error | 3            | User was not superuser.           | User was not root user.                              | Log in as root user.                                       |
| genw        | Error | 4            | Getting of config was failed.     | Failed to get the cluster configuration information. | Check if the cluster configuration information exists.     |
| genw        | Error | 5            | Parameter was invalid.            | The parameter is invalid.                            | Check if the cluster configuration information is correct. |
| genw        | Error | 6            | Option was invalid.               | The parameter is invalid.                            | Check if the cluster configuration information is correct. |

| oclbw       | Warning | 189          | Internal error. (status=%1)      | Internal error occurred.         | Memory or OS resources may not be sufficient. Check them.                                                                                       |

### 11.5.34 Monitoring option monitor resource

Monitor resources of monitoring options use common messages. Module types are different for each monitoring option monitor resource.

| Monitoring option monitor resource | Module type |
|------------------------------------|-------------|
| DB2 monitor resource               | db2w        |
| FTP monitor resource               | ftpw        |
| HTTP monitor resource              | httpw       |
| IMAP4 monitor resource             | imap4w      |
| MySQL monitor resource             | mysqlw      |
| NFS monitor resource               | nfsw        |
| ODBC monitor resource              | odbcw       |
| Oracle monitor resource            | oracle      |
| POP3 monitor resource              | pop3w       |
| PostgreSQL monitor resource        | psqlw       |
| Samba monitor resource             | sambaw      |
| SMTP monitor resource              | smtpw       |
| SQL Server monitor resource        | sqlserverw  |
| Sybase monitor resource            | sybasew     |
| Tuxedo monitor resource            | tuxw        |
| WebSphere monitor resource         | wasw        |
| WebLogic monitor resource          | wls         |
| WebOTX monitor resource            | otxw        |

| Module type          | Type    | Return value | Message                                                     | Description                                                                              | Solution                                                                                                        |
|----------------------|---------|--------------|-------------------------------------------------------------|------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| (see the list above) | Error   | 5            | Failed to connect to %1 server. [ret=%2] %3:                | Failed to connect to the monitor target.                                                 | Check the status of the monitor target.<br>The actual module type is displayed in %1.                           |

## 11.6 JVM monitor resource log output messages

The following messages belong to the JVM operation log files that are specific to the JVM monitor resources.

The file is created in the following location:

JVM operation log: <EXPRESSCLUSTER\_install\_path>/log/ha/jra/jragent\*.log (\* indicates a number starting at 0.)

### 11.6.1 JVM operation log

| Message                                                    | Cause of generation                                                                                                                                                                                                                                                                                                                                                 | Action                                                                            |

## 11.7 Details on checking cluster configuration data

### 11.7.1 Cluster Properties

| Check item                               | ID   | Message                                                                        | Action                                                     |
|------------------------------------------|------|--------------------------------------------------------------------------------|------------------------------------------------------------|
| Ping check on the NP resolution resource | 1001 | Failed.                                                                        | Check if the ping (ping6) command is available.            |
|                                          | 1002 | Ping could not reach to %1.                                                    | Check if an IP address reachable with a ping is set.       |
| Number check on Port No. tab             | 1011 | Failed.                                                                        | Check if the sysctl command is available.                  |
|                                          | 1012 | The port number %1 is within the range of automatically assigned port numbers. | Specify a port number which is not automatically assigned. |
| Number check on Port No.(Mirror) tab     | 1021 | Failed.                                                                        | Check if the sysctl command is available.                  |
|                                          | 1022 | The port number %1 is within the range of automatically assigned port numbers. | Specify a port number which is not automatically assigned. |
| Number check on Port No.(Log) tab        | 1031 | Failed.                                                                        | Check if the sysctl command is available.                  |
|                                          | 1032 | The port number %1 is within the range of automatically assigned port numbers. | Specify a port number which is not automatically assigned. |

### 11.7.2 Group Resources

| Check item                          | ID   | Message                            | Action                                                                       |
|-------------------------------------|------|------------------------------------|------------------------------------------------------------------------------|
| Ping check on fip                   | 2001 | Failed.                            | Check if the ping (ping6) command is available.                              |
|                                     | 2002 | %1 is used already.                | Specify an unused IP address in the LAN to which the cluster servers belong. |
| Ping check on vip                   | 2011 | Failed.                            | Check if the ping (ping6) command is available.                              |
|                                     | 2012 | %1 is used already.                | Specify an unused IP address in the LAN to which the cluster servers belong. |
| Partition presence check for disk   | 2021 | %1 does not exist.                 | Specify an existing device name.                                             |
| Partition presence check for md     | 2031 | %1 does not exist.                 | Specify an existing device name.                                             |
| Partition presence check for hd     | 2041 | %1 does not exist.                 | Specify an existing device name.                                             |
| Cluster partition size check for md | 2111 | In %1, the size is less than 1 GB. | Set the disk size to 1 GB or more.                                           |
| Cluster partition size check for hd | 2121 | In %1, the size is less than 1 GB. | Set the disk size to 1 GB or more.                                           |

|                                 | 5052 | zip command is not found.                                                | Install the zip command.                                                                                                                                                                                                         |

## 11.7.5 Unrecommended settings check

| Check item                                         | ID   | Message                                                                                                                         | Action                                                                                                                |
|----------------------------------------------------|------|---------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Recovery action check for deactivation failure(%1) | 6001 | "No operation" is set for Recovery Operation at Deactivation Failure Detection.<br>It is recommended to select any other value. | It is recommended to select a value other than "No operation" for the final action on deactivation failure detection. |

## GLOSSARY

**GC** Abbreviation for garbage collection

**Java heap** Area in which the Java VM allocates memory according to a memory acquisition request from a Java application. Target of GC

**Java memory pool** Memory area prepared by the Java VM for Java applications

**JMX** Abbreviation for Java Management Extensions. Specification used for Java that manages and monitors the hardware and software in the network

**JVM operation log** File for recording JVM monitor resource operation information. The file is created in the following location:

`<EXPRESSCLUSTER_install_path>/log/ha/jra/jragent*.log`

(\* indicates a number starting at 0.)

**JVM statistics log** File for recording statistics obtained from JVM monitor resource. The file is created in the following location:

`<EXPRESSCLUSTER_install_path>/log/ha/jra/*.stat`

**Interconnect** A dedicated communication path for server-to-server communication in a cluster.

(Related terms: Private LAN, Public LAN)

**Virtual IP address** IP address used to configure a remote cluster.

**Management client** Any machine that uses the Cluster WebUI to access and manage a cluster system.

**Startup attribute** A failover group attribute that determines whether a failover group should be started up automatically or manually when a cluster is started.

**Shared disk** A disk that multiple servers can access.

**Shared disk type cluster** A cluster system that uses one or more shared disks.

**Switchable partition** A disk partition connected to multiple computers and is switchable among computers.

(Related terms: Disk heartbeat partition)

**Cluster system** Multiple computers are connected via a LAN (or other network) and behave as if it were a single system.

**Cluster shutdown** To shut down an entire cluster system (all servers that configure a cluster system).

**Cluster partition** A partition on a mirror disk or a hybrid disk. Used for managing mirror disks or hybrid disks.

(Related term: Disk heartbeat partition)

**Active server** A server that is running for an application set.

(Related term: Standby server)

**Secondary server** A destination server where a failover group fails over to during normal operations.

(Related term: Primary server)

**Standby server** A server that is not an active server.

(Related term: Active server)

**Disk heartbeat partition** A partition used for heartbeat communication in a shared disk type cluster.

**Data partition** A local disk that can be used as a shared disk for switchable partition. Data partition for mirror disks or hybrid disks.

(Related term: Cluster partition)

**Network partition** All heartbeat is lost and the network between servers is partitioned.

(Related terms: Interconnect, Heartbeat)

**Node** A server that is part of a cluster in a cluster system. In networking terminology, it refers to devices, including computers and routers, that can transmit, receive, or process signals.

**Heartbeat** Signals that servers in a cluster send to each other to detect a failure in a cluster.

(Related terms: Interconnect, Network partition)

**Public LAN** A communication channel between clients and servers.

(Related terms: Interconnect, Private LAN)

**Failover** The process of a standby server taking over the group of resources that the active server previously was handling due to error detection.

**Failback** A process of returning an application back to an active server after an application fails over to another server.

**Failover group** A group of cluster resources and attributes required to execute an application.

**Moving failover group** Moving an application from an active server to a standby server by a user.

**Failover policy** A priority list of servers that a group can fail over to.

**Private LAN** LAN in which only servers configured in a clustered system are connected.

(Related terms: Interconnect, Public LAN)

**Primary (server)** A server that is the main server for a failover group.

(Related term: Secondary server)

**Floating IP address** Clients can transparently switch one server from another when a failover occurs.

Any unassigned IP address that has the same network address that a cluster server belongs to can be used as a floating address.

**Master server** Server displayed on top of the Master Server in Server Common Properties in the Cluster WebUI

**Mirror disk connect** LAN used for data mirroring in mirror disk or hybrid disk. Mirror connect can be used with primary interconnect.

**Mirror disk type cluster** A cluster system that does not use a shared disk. Local disks of the servers are mirrored.
